METALLIZED POLYPROPYLENE FILM CAPACITOR (EMI SUPPRESSION CLASS-X2)

General technical information

Depending on the way they are connected two principal classes of capacitors have been defined for fixed capacitors for electromagnetic interference suppression and connection to the supply mains, Class X and Y.

Class " X " Capacitors

X Capacitors which are connected between the line phases are effective against symmetrical interference (differential mode). A type is suitable for use in situations where failure of the capacitor would not lead to danger of electrical shock.

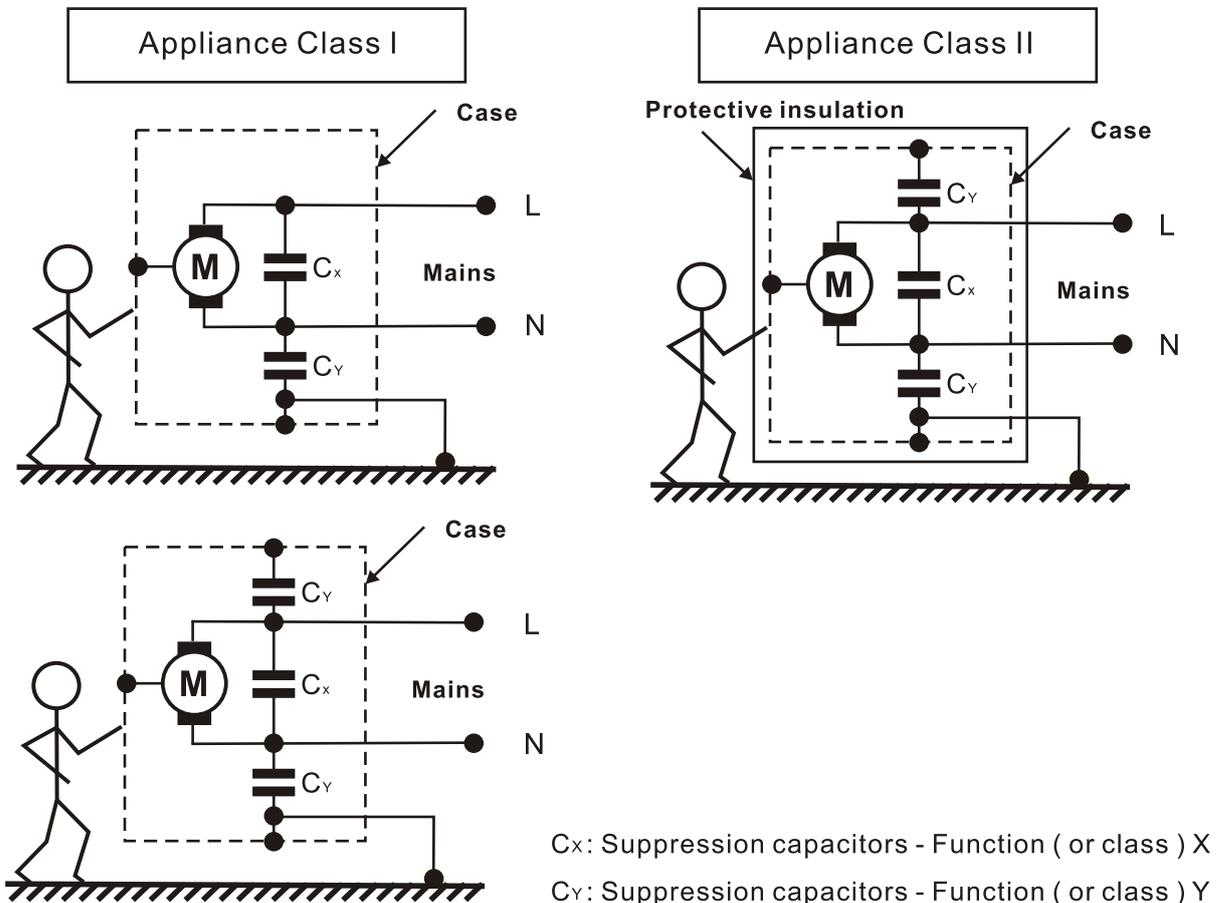

Class X capacitor are divided into three subclasses X1, X2, X3.

Class " Y " Capacitors

Y capacitors which are connected between a phase and neutral (zero potential) are effective against asymmetrical interference (common mode).

A type is suitable for use in situations where failure of the capacitor could lead to danger of electric shock.

Class Y capacitor are divided into four subclasses Y1, Y2, Y3, Y4.

The example above show protection and suppression of a mains by using X and Y capacitors.
